Preface

Alaska Population Overview is designed to provide frequently requested population information in one publication. In order to provide a consistent set of data, this publication presents the resident population of Alaska under exactly the same concepts and definitions used by the U.S. Bureau of the Census for the 1980 Decennial Census of Alaska.

This edition of *Alaska Population Overview* is composed of five sections. The first section summarizes some of the key demographic facts from this publication. The next three sections cover current and historical population estimates for the State, boroughs and census areas, and places. The last section of this publication contains special reports on major topics of demographic interest to the state.

Population projections which have on occasion appeared in *Alaska Population Overview* will no longer appear in this publication but will be available in a separate publication, *Alaska Population Projections*, available in the winter of 1985-86.

THE STATISTICS WHICH APPEAR IN THIS ISSUE OF *ALASKA POPULATION OVERVIEW* IN A NUMBER OF INSTANCES ARE REVISIONS OF FIGURES APPEARING IN EARLIER ISSUES OF THIS PUBLICATION AND SUPERCEDE THOSE EARLIER STATISTICS.

ALTHOUGH ESTIMATES IN THIS PUBLICATION ARE PUBLISHED IN UNROUNDED FORM FOR EASE OF USE IN OTHER COMPUTATIONS, THE READER SHOULD NOT ASSUME THAT ANY ESTIMATES ARE ACCURATE TO THE LAST PLACE. IN GENERAL, THE STATE ESTIMATE SHOULD BE ASSUMED TO BE ACCURATE TO THE NEAREST THOUSAND AND BOROUGH AND CENSUS AREA ESTIMATES SHOULD BE ASSUMED TO BE ACCURATE TO THE NEAREST HUNDRED.

Any comments or suggestions regarding the contents or format of this publication are welcomed. General requests for demographic information should be addressed to Brian Rae. Specific questions dealing with the special topics should be addressed to the following people: 1980 Census data and U.S. Census Bureau publications, Kathryn Lizik; federal intercensal population estimates and special census activities, Jo Van Patten; current State estimates, projections, and methods, Greg Williams. The telephone number for the Demographics Unit is 907-465-4500.

Special acknowledgment is given to the Department of Health and Social Services, Vital Statistics Division, the Department of Education; and each of the city and borough officials and staff members who provided data and worked cooperatively in developing the 1984 population determinations. Information on military personnel was provided by the personnel departments of the service branches represented in Alaska whose assistance is greatly appreciated. Special thanks also goes to Brian Rae for his aid in preparing the tables and figures in this publication. Jim Fowler, Graphic Artist and Marilyn Gunn, Phototypesetter Operator also deserve thanks for preparing the copy for publication.

I. Overview

Overview

Chapter II
Alaska State Population Trends 1945 to 1984

* The population of the United States on July 1, 1984 was 236,681,000.

* The Department of Labor estimates Alaska's population on July 1, 1984 was 523,000. The revised estimate for July 1, 1983 was 495,300. The population on April 1, 1980 was 401,851.

* During the early 1980's, Alaska has been the most rapidly growing state in the United States. The Average Annual Rate of Growth between the 1980 Census and July 1, 1983 was 6.4% per year. The rate of growth from July 1, 1983 to July 1, 1984 was 5.5%, implying a slowing of growth. Current expectations are for a further reduction in the rate of growth for the period from 1984 to 1985. The Average Annual Rate of Growth for the U.S. as a whole during the 1980-84 period was 1.0% per year

* By the Alaska Department of Labor estimate, Alaska is now the 50th largest "state", counting Washington D.C., passing Wyoming whose population on July 1, 1984 was estimated to be 511,000.

* Alaska's land area consists of 570,833 square miles or 16.3% of the total land area of the United States. Alaska's population in 1984 consisted of 0.2% of the population of the United States.

* In 1984, Alaska had 0.91 persons per square mile. Excluding Anchorage, the remainder of Alaska had 0.49 persons per square mile.

* Between July 1, 1983 and July 1, 1984: 12,208 persons were born in Alaska and 1,903 persons died for a net natural increase of 10,305 persons. In this same period, Alaska gained 17,453 persons through migration.

* Overall, Alaska's population, while aging like the rest of the U.S., remains very young. In 1984, the median age of Alaskans was 27.5 years compared to 26.1 years in 1980. During the same period the median age of the U.S. population has increased from 30.0 to 31.1 years.

* There were about 55,000 children under 5 years old, almost 11% of the population. The proportion under 5 years of age for the U.S. was 7.7%.

* In 1984, approximately 112,000 persons, or 21% of the population, were of elementary and secondary school age (5-17) in Alaska. Nationwide, 18.8% of the population was of school age.

* 341,335 persons, or 65.26% of the population, were in the adult working ages of 18-64. Nationwide, 61.7% of the population was of adult working age.

* In 1984, Alaska's population had nearly 15,000 persons (or 2.8%) 65 years old or older. The proportion over 65 nationwide, was 11.8%.

* Of the 523,000 persons in 1984: 397,800, or 76%, were White; 75,000, or 14%, were American Indian, Eskimo, or Aleut; 21,500, or 4.1%, were Black; and the remaining 28,000, or 5.4%, were Asian or 'Other Race' in origins.

* In 1984, 243,700, or 46.6%, of Alaska's population were female compared to 51.3% female for the United States as a whole.

Chapter III
Population Trends for Alaska Census Areas

- In 1984, 243,829 persons, or 46.6% of Alaska's population, lived in the Municipality of Anchorage.

- Alaska grew by 121,197 persons between April 1, 1980 and July 1, 1984, an increase of 30% in 4.25 years. Ninety percent of the growth since the 1980 census has occurred in Anchorage (+69,398), Kenai Peninsula Borough (+13,003), Matanuska-Susitna Borough (+12,020), Fairbanks North Star Borough (+10,203) and Juneau Borough (+4,201).

- In 1984, there were approximately 22,600 military personnel in Alaska, slightly higher than in 1980. The proportion of military personnel within the State continues to decline from 5.5% of the State's population in 1980 to 4.3% in 1984. Military dependents in 1984 made up another 26,800 persons, making the proportion of military and dependents in Alaska approximately 9.5% of the States' population.

Chapter IV
Population Estimates for Places 1980, 1983-1984

- In Alaska as in the U.S. as a whole approximately 73% of all Occupied Housing Units are occupied by families.

- A slim majority (51%) of Alaska's Native population still lives in predominantly Native communities (75% or more Native).

- Slightly over one-third (35%) of Alaska Natives live in communities with less than a 25% Native population.

- Only 3% of the non-Native population of Alaska live in communities which have a Native population of more than 25%.

- In 1984, almost 45% of Alaska's municipalities conducted local censuses, acceptable Housing Unit Surveys or had full population count rosters.

- Since 1980, 82% of all the incorporated places and 60% of the boroughs in Alaska have conducted local censuses, acceptable Housing Unit Surveys or full population count rosters.

Chapter V.3.1
Local Area Census Program

- The Alaska Department of Labor aids local communities in doing local area censuses for federal and state revenue sharing purposes. Methods for conducting accurate local censuses and their costs are discussed.

- In FY 83 the federal government allocated 366.6 million dollars to various federal programs in Alaska using population as a basis for distribution.

- The Alaska Department of Labor has administered 13 municipal or boroughwide census. These censuses counted 136,804 people, about 30% of the average Alaska population during the 1980-1984 period.

Chapter V.3.2
1990 Census Planning in Alaska

- Planning for the 1990 census has already begun. Geographic units which will be used in 1990 are being defined this year. The Census Bureau has also been soliciting public input into 1990 census content. All the major tasks which must be accomplished to conduct a National census in Alaska are discussed.

Chapter V.3.3
Migration to and from Alaska

* Of all the people who have moved to or from Alaska in the 1980's, about half moved from or to: Washington (14%), California (12%), Oregon (7%), Texas (7%), Colorado (4%), Florida (4%), Idaho (3%), or Arizona (3%). The remaining states each contributed 2% or less to the stream of migrants.

* The regional distribution of persons who moved to and from Alaska in the 1980's are as follows: Pacific (34%), Mountain (16%), South Atlantic (13%), West South Central (11%), East North Central (7%), West North Central (7%), East South Central (4%), Middle Atlantic (4%), and New England (3%).

* During 1982-83, the census areas which had the highest net gain in population because of migration from other areas of Alaska were: Matanuska-Susitna 12.8%, Haines 3.3%, Kenai 1.5%, Nome 1.3%, and Juneau 1.0%.

* During 1982-83, the census areas which had over 5% net gain in population as a result of migration from out of state were: Anchorage (8.5%), Matanuska-Susitna (7.9%), Fairbanks North Star (6.4%), Bristol Bay (6.2%), Prince of Wales-Outer Ketchikan (5.9%), Southeast Fairbanks (5.7%), Kenai (5.6%), Ketchikan Gateway (5.6%), Valdez-Cordova (5.1%), and Juneau (5.0%).

II. Alaska State Population Trends
1945 to 1984

Population Trends

The population estimate for the United States on July 1, 1984 was 236,681,000. The Alaska Department of Labor estimates Alaska's population on July 1, 1984 was 523,048. Counting the District of Columbia there are 51 "states" for population purposes. By our estimate, Alaska is now the 50th largest state, passing Wyoming whose population on July 1, 1984 was estimated to be 511,000, and rapidly gaining on Vermont, whose 1984 population was estimated at 530,000.

Alaska's land area consists of 570,833 square miles, or 16.3% of the total land area of the United States. Alaska's population in 1984 consisted of 0.2% of the population of the United States. While it may be getting too crowded for some, the Great Land is still very sparsely populated, having an average of 0.91 persons per square mile. Excluding Anchorage, which contained 46% of the State's population, the remainder of Alaska averaged 0.49 persons per square mile. Most Alaskans live in towns and villages or clustered settlements. Few live alone in the rural area. As a result, great sections of Alaska still remain almost uninhabited.

Alaska's population growth since World War II has been impressive, as shown in Table II.1 and Figure II.1. The end of World War II until 1952 was a period of very rapid growth. The Average Annual Growth Rate *1/* for this period was 9.6% per year. From 1952 to 1965, Alaska underwent a much slower, but smoother Average Annual Growth Rate of 2.7% per year. During the period from 1965-1973 development gradually increased, producing an Average Annual Growth Rate of 3.0% per year.

The oil pipeline began to have an impact in 1973-76, peaking in 1975. The Average Annual Growth Rate during this period was 6.6% per year. The completion of the pipeline construction "boom" was clearly followed by a "bust" during the 1976-80 period. During 1977-78, Alaska actually lost about 6,400 people. The Average Annual Growth Rate over the four year period, however, was 0.6% per year.

Figure II.1
Alaska Population Trends
1945-46 to 1983-84

1983-84	523048	27758	12208	1903	10305	17453

Alaska Department of Labor, Research & Analysis, Demographic Unit, 1985.

Beginning in 1981, another boom began, primarily as the result of construction and infrastructure development fueled by state spending and private development based on oil revenues. As a result, Alaska's population has grown by approximately 30% in four and a quarter years, making it the most rapidly growing state in the Nation since 1980. The main part of this growth occurred from 1980-1983 during which the Average Annual Growth Rate was 5.9% per year. The peak of this growth occurred in 1982-83 and began to slow during 1983-84 with an Average Annual Growth Rate of 5.5%. The Average Annual Growth Rate for the U.S. as a whole during the 1980-84 period was 1.0% per year.

While no official estimates of the population exist yet for July 1, 1985, preliminary indications are that growth will be slowing much as it did in the 1976-77 period after the oil boom. The trend toward slower, more moderate growth has resulted from a slow down in capital spending by state government and private enterprise, which in turn reflects the current lower price of oil on the world market. If the net balance of migration to Alaska during 1984-85 were to be zero, which seems unlikely, the 1985 population of the State should reach 533,000 due to natural increase alone.

The pace of economic growth, and in turn the population of Alaska, will depend upon the relative demand for Alaskan resources in the U.S. and world economies and federal spending in Alaska. Despite fluctuations in Alaska's population growth, the overall trend during the post-war period has been towards strong positive growth, with over a fivefold increase in population since 1946. While economic optimism and investment, particularly in construction, in some areas of Alaska has periodically been greater than underlying demographic conditions have warranted, overall population growth should continue.

1/ An Average Annual Growth Rate is a statistical measure of the rate of change which can be compared for any number of years because it converts the change for any time period to a yearly rate.

Population Size and Growth

Components of Change

Population change is composed of natural increase (births-deaths), and migration as shown in Table II.1 and Figures II.2 and II.3. In general, natural increase is the relatively stable component of population change. Death rates change very slowly, and while current fertility fluctuates depending on a variety of factors, the general trend in births does not change pace or direction too quickly. Migration is the most unstable component in Alaska's population change, often changing dramatically from one year to the next.

Between July 1, 1983 and July 1, 1984: 12,208 persons were born in Alaska and 1,903 persons died for a net natural increase of 10,305 persons. Alaska's population is currently growing by 2.1% per year as a result of natural increase. The births which occur to Alaskans each year are currently equivalent to about 2.5% of the population at the beginning of each year. Approximately 0.4% of Alaska's population currently dies each year.

The highest post-World War II proportional growth due to migration occurred during the build up for the Korean War in 1950-51 (14.7%), 1951-52 (13.6%), and during 1945-46 (12.3%). In part, these high percentages were a result of a small population base in these years. The net migration for 1982-83 was numerically larger than in 1950-51, but was equivalent to only 5.3% of the 1982 population. The largest single numerical increase due to migration (30,235 or 8.7%), occurred during pipeline construction in 1974-75. The largest numerical loss (-13,356 or -3.2%), occurred at the end of the pipeline construction in 1977-78. Between July 1, 1983 and July 1, 1984, Alaska gained 17,453 persons through migration. This is 1.7 times the gain through natural increase.

Age Composition

The model used to produce 1980-84 age/race/sex estimates is a cohort component model. It uses current detailed Alaskan mortality and fertility and detailed patterns of migration from the 1970-80 period. This is the most recent information available on the age/race/sex composition of migrants. The model allows the migration pattern to be modified to allow for the shifting family composition of migrants. In this way, the age structure can be made to correspond to known elementary school enrollments.

Since there was insufficient evidence on migration of persons over 65 during the 1980's, migration for older Alaskans was held constant in the model. The resulting growth in the estimate of persons in this age group reflects primarily the increasing number of Alaskan's reaching retirement age. Figure II.4 shows the estimated age pattern of migrants by sex for 1983-84.

The trends in population growth for various age groups differ substantially from that of the population as a whole due to differences in fertility, mortality, and migration trends by age. For example, nationwide fertility rates have been on the decline, having a substantial impact on the size of the younger cohorts during the remainder of this century. Alaska's fertility has always been, and still is, above the national average. These age trends are shown in Table II.2 and Figure II.5.

The size of each age group in the population under forty has been affected by a number of events. The first key event was the "baby boom" which began after World War II, and peaked during the late 1950's and early 60's. That boom occurred when the American family began to average one more child (a third child) per family, compared to the depression and war years, and the number we see today. In addition, the age at first marriage dropped and children were spaced a little closer together than in the preceding decades. During the late 1960's and 1970's, the average family size began to decline due to increasing female labor force participation, changing life styles, and better family planning.

In general, Americans still preferred to have their children in rapid succession shortly after marriage, but marriage has been postponed till later. Current fertility reached a low point in 1975 and has increased slowly since that time. The number of children being born each year is increasing again primarily as a result of the "baby boom" generation reaching child bearing age. The baby boom generation has married later, postponed children and have had fewer children to date. If they continue having children at this rate they will not replace their numbers. If, however, they have two children per family they will produce another wave of births equivalent in numbers to the baby boom of the 1950's and 1960's.

While these trends are reflected as part of the changing age structure of Alaskans, fertility has less of an impact on the population than does migration.

Overall, Alaska's population, while aging like the rest of the U.S., remains very young. In 1984, the median age of Alaskans was 27.5 years compared to 26.1 years in 1980. During the same period the median age of the U.S. population has increased from 30.0 to 31.1 years.

There were some 55,000 children under the age of 5 in Alaska in 1984 and between 1980 and 1984 there has been a 41% increase in the number of children under 5 in Alaska, indicating that this age group has been growing more rapidly than the population as a whole.

The population 5-13, those persons of elementary and junior high school age, grew rapidly until 1975, declined during the late 1970's but have increased again to about 87,000 by 1984.

The population of high school age has been much more stable over the years. Alaska's population has traditionally been too young to have many high school aged children. Additionally, substantial numbers of high school age students have in the past attended boarding schools outside Alaska. However,in 1984 there were almost 34,000 persons 14-17 in Alaska.

While the number of young adults 18-24 nationwide is declining dramatically, this age group has continued to increase in Alaska in the early 1980's, with a population of 64,000.

The population 25-34 is composed of young adults in the prime ages for family and household formation. By our estimate, there may be as many as 131,000 such young adults in Alaska in 1984. This age group has shown an increase of almost 44% since 1980. No other age group has increased more rapidly than this one. It is the families in this age group that contributes to the rapid growth of children under 5.

The population 35-44 represents the leading edge of the post World War II "baby boom". Rapid growth in this age group since 1980 has resulted from an increased migration of more established families. In 1984, there were about 79,000 persons in this age group in Alaska, an increase of over 47% since 1980.

The populations 45-54 and 55-64 have traditionally been an age at which many Alaskans began to move south. In 1984, we estimate there were about 41,000 persons 45-54 and 26,000 persons 55-64 in the state. In general, middle aged Alaskans are becoming more willing to stay for a longer time.

Our 1984 estimate of the number of persons 65 years old or over is almost 15,000. Considering the size of the population currently 55-64, the number of senior Alaskan's is likely to increase rapidly in coming years. The estimate suggests a 27% increase in older Alaskan's since 1980. These estimates are similar to those produced by the U.S. Census Bureau which suggests that Alaska has one the most rapid percent increases in the population over 65 of any state in the union.

Race and Sex Composition

The 1980 census showed that 92,123 persons, or 22.9% of the population of Alaska, considered themselves to be some race other than White. Of this nonwhite group, 64,103 (or 16.0%) were listed as Native American; Eskimo (34,144 or 8.5%), American Indian (21,869 or 5.4%), Aleut (8,090 or 2.0%). In addition, 13,144 (or 3.3%) were Black, 8,054 (or 2.0%) were Asian and Pacific Islanders, and 6,323 (or 1.6%) were composed of a variety of other racial groups or combination of racial groups.

Of the 523,000 persons living in Alaska in 1984, approximately 125,000 (or 24.0%) were estimated to be of a race other than White. Native Americans (Eskimo, American Indian, or Aleut) made up 75,000 (or 14.3%) of the population. The Black population was estimated to be 22,000 (or 4.1%). The remaining 28,000 (or 5.4%) were Asian or 'Other Race' in origins.

Persons of Spanish Origin may claim to be of any race. In 1980, 9,507 persons or 2.4% of the population claimed to be of Spanish Origin. Of these: 5,093 listed themselves as White; 222 listed themselves as Black; and 4,192 listed themselves as 'Other Races'. It is probable that many of the persons listed as 'Other Races' above wrote in some Spanish Origin ethnic or country name in 1980. No attempt has been made to estimate the number of persons of Spanish Origin in Alaska since the 1980 Census. Informal reports would suggest that the number of persons of Spanish Origin is increasing in Alaska at a pace equal to or greater than the general increase in the population.

In 1984, 243,700 persons (or 46.6%), of Alaska's population were female compared to 51.3% female for the United States as a whole for 1984. Traditionally, a high ratio of males to females has been associated with the American frontier. Certain Alaskan communities tend to be predominantly male because employment may be transient or concentrate in occupations which have traditionally employed mostly males. These include: some military installations, and logging, fishing, or mining camps. The young age of the population also increases the proportion male. Older populations tend to have more women because of the greater life expectancy among women at older ages.

Intercensal and Current Estimates

Estimates are presented in Tables II.3 and II.4 by detailed age/race/sex for the period from 1984 back to 1970. This is the first time estimates have been prepared for frequently requested specific age groups and for the Native population of Alaska.

The intercensal estimates for the 1970's are based on the post-1970 Alaska Department of Labor estimates published in *Alaska Population Overview 1981.* These estimates were produced by linear interpolation of each age/race/sex group between 1970 and 1980. The estimates were then controlled to the 1970-80 State estimates in such a manner that the Native population has retained its linear interpolation while the White, Black and Other populations were adjusted.

Selective controls were used so that the level of native migration in the intercensal years would not be overestimated. Native migration between 1970 and 1980 is known to be much lower than the migration patterns for other races in Alaska . The estimate was also produced to conform to the published 1970 and 1980 Census numbers. The 1970 census, however, was corrected after publication. The post census correction consisted of 2,201 persons, or 0.7% of the State's population, the majority of which was at Elmendorf AFB. The age/race/sex composition of that correction is unknown. As a result, no attempt was made in this set of estimates to adjust the 1970 number for that census error or for any possible undercount. Since controls were used for 1971-79, the impact of this census error should only be seen in the 1970 and possibly the 1971 estimate. Overall, the impact on the estimates is minor.

A different series that attempted to take into account 1970 census corrections and undercounts was published for broad age groups in the *Alaska Population Overview 1982*. The undercount from the 1980 Census in Alaska is as yet unknown but estimates should be released by the U.S. Census Bureau in the next year. Once these become available a revised intercensal series will be made available to users.

Alaska Department of Labor, Research & Analysis, Demographic Unit, 1985.

Methodology

The State of Alaska currently participates with the U.S. Census Bureau in the Federal State Cooperative for Local Population Estimates and strictly ascribes to U.S. Census Bureau definitions and standard demographic methodologies. Since the 1980 Census there has, however, been some disagreement between the U.S. Census Bureau and the Alaska Department of Labor and other Federal State Cooperative Participants over the methodology used to produce state estimates. Testing and discussions are still underway to try to resolve these differences.

While nearly all statistics presented in this publication represent estimates generated by the Alaska Department of Labor, some users are required by law to use U.S. Census Bureau statistics in preparing reports, grant proposals and other documents. For these users, Table II.5 and Figure II.6 show federal estimates compared to those of the Alaska Department of Labor. The following section discusses the differences between Census Bureau and Alaska Department of Labor methodology relative to the current round of estimates.

Census Bureau Methodology

State estimates as produced by the Census Bureau for the 1980's are currently developed by averaging the results of two methods: an Administrative Records Method and a Composite Method. The sum of the state estimates is controlled to a national estimate. This means that the sum of the states may not be larger than the national estimate.

The Administrative Records method is a component procedure for estimating the population under age 65. The estimate is developed by using 1) the 1980 census counts to calculate the persons under age 65 on the estimate date, 2) adding the births for the time period between the base year and the estimate year, 3) subtracting deaths occurring in this period to persons under age 65 on the date of estimation, 4) adding net migration derived from IRS tax return change of address, and 5) adding an estimate of immigration from abroad. The population over age 65 is estimated from medicare recipients. (IRS migration is discussed in greater detail in the article in Section V.3 of this report.)

The Composite method uses different techniques to independently estimate different age segments of the population. The different age groups are: 0-14, 15-64, and 65 and over.

In estimating the 0-14 age group the statistics on Alaska births and U.S. death rates by whites and nonwhites are used as well as elementary school enrollment statistics. The population 0-14 years of age for each estimate period was developed by components of change. The age cohorts 0-4 and 5-14 on the estimate date were derived using the 1980 census and birth statistics. To each age group was added an estimate of deaths and an estimate of net migration derived from the relationship of school enrollment to population at the time of the census and the current estimate. Then the assumption was made that at each age 0-4 and 5-14 age cohorts shared equally in the cumulative school-age migration.

In estimating the population in ages 15 to 64, a ratio correlation approach is used. The percent changes in the state distributions of three symptomatic variables from 1980 to the estimate year were used to estimate the percentage changes in each state's distribution of the household population 15-64 years of age from 1980 to the estimate year. The estimated state percent change in population was multiplied by Alaska's share of the 1980 U.S. population to yield a preliminary estimate of the Alaska population in the estimate year. The preliminary distribution of all states was then proportionately adjusted to an independent national estimate of the population in the estimate year.

The estimate of the change in a state's share of the national population from 1980 to the estimate year was calculated from a Linear Regression equation, relating the percent change in the distribution of population (the dependent variable) between 1970 (adjusted for undercount) and 1980, and the percent change in the distribution of three independent variables. These were 1) school enrollment 2) the number of federal income tax returns filed by persons under 65 years of age, and 3) an estimate of the number of housing units.

The population over 65 was estimated from the change in Medicare enrollees as it was in the Administrative Records Method.

Alaska Department of Labor State Estimates

In generating Alaska Department of Labor State estimates for 1983 and 1984, the independent results of the Census Bureau's

Administrative Records method was adopted pending further testing of State estimates methodology. There were only minor differences between the Bureau's Administrative records estimate and ours. First, the Alaska Department of Labor estimate uses more current birth data and actual Alaska deaths, rather than assuming national death rates. In addition, our estimate was computed on a single year rather than a two year basis. Most importantly, our estimates were not adjusted to a national total after each year. Our preliminary testing indicates that proportional raking of the estimate of the non-group quarters cohort of persons less than 65 for 1982 to the national estimate is primarily responsible for differences between the U.S. Census Bureau and Alaska's State Administrative Records estimates. Our State estimates are consistent with provisional 1984 U.S. Bureau of the Census Subcounty Estimates which are also computed by an Administrative Records technique.

In preliminary tests, the Census Bureau Composite estimate produces estimates which are completely unrealistic when compared with all other sources of information for Alaska. Thus, averaging this method with the Administrative Record method produces what we consider to be a serious bias in the U.S. Census Bureau's current estimate for Alaska.

While room does not allow a detailed discussion here, the main problem with the Composite method appears to lie in the regression equation indicators used to estimate the population 15-64 for Alaska.

The recently published federal revenue sharing July 1, 1984 estimates for Alaska is 508,062. This is lower than provisional unpublished subcounty estimates. The main difference between these estimates and ours and between provisional and published subcounty estimates is accounted for by the estimate for Anchorage of 226,663, compared with our estimate of 243,829. If Anchorage's challenge to the federal revenue sharing estimates is successful, as it was in 1982, this will raise the federal revenue sharing total for Alaska to approximately 525,000, which is almost the same as our current provisional Alaska total of 523,000 for July 1, 1984.

III. Population Trends for Alaska Census Areas

Population Size and Growth

Alaska grew by 121,197 persons between April 1, 1980 and July 1, 1984, an increase of 30% in 4.25 years. The distribution and trend in Alaska boroughs and census areas for the period from 1970-80, 1980-83, and 1983-84 can be seen in Table III.1 and the borough and census area populations for 1970, 1980, and 1984 are shown in Figure III.1. Table III.2 shows the birth, death, and migration components of Alaska's 1984 population. In 1984, 243,829 persons or 46.6% of Alaska's population lived in the Municipality of Anchorage. The five largest census areas are: Anchorage, Fairbanks Northstar (64,186), Kenai Peninsula (38,285), Matanuska-Susitna (29,836), and Juneau (23,729). These contained 76.4% of Alaska's population in 1984. In 1980, these census areas made up only 72.4% of Alaska's population. The remainder of the state contained 123,183 persons in 1984.

Growth in the 1980's has been predominately in the urban and suburban areas of Alaska. These same five census areas contained ninety percent of the growth since the 1980 census: Anchorage (+69,398 or 39.8% increase), Kenai Peninsula Borough (+13,003 or 51.4% increase) and Matanuska-Susitna (+12,020 or 67.5% increase), Fairbanks North Star Borough (+10,203 or 18.9% increase), and the Juneau Borough (+4,201 or 21.5% increase). Growth has been somewhat slower, but still rapid by national standards in the balance of the State. The balance of the State grew by 12,372 or an 11.2% increase since 1980.

Military Population

The role of the military population in Alaska has always been significant to the state's population and population growth. Currently the military population of Alaska is relatively stable and because of the rapid increase in the civilian population since 1980 has declined as a proportion of the total population of the State.

In 1984, as shown in Table III.3, there were approximately 22,600 military personnel in Alaska, slightly higher than in 1980. The proportion of military continues to decline from 5.5% of the State's population in 1980 to 4.3% in 1984. Military dependents in 1984 made up another 26,800 persons, making the proportion of military and dependents in Alaska approximately 9.5% of the State's population. The census areas of Alaska with the largest number and proportion of military personnel and dependents are: Anchorage (25,826 or 10.6%), Fairbanks Northstar Borough (14,059 or 21.9%), Aleutian Islands (3,791 or 45.9%), Kodiak (2,420 or 19.5%), and Southeast Fairbanks (1,858 or 29.6%).

Methods

Census area population was computed by averaging of two techniques: Administrative Records and Regression. Boroughs conducting full censuses by the approved Housing Unit method override either of these techniques. The remaining boroughs and census areas are controlled to the State total population. This technique usually is sufficient. However, in some census areas there are enough local censuses by approved techniques so that the census area estimate would produce unreasonable results for the non-censused areas. Some census area estimates were adjusted within the controlled state total to produce reasonable local populations and rural balances.

This procedure is slightly different from that used by the U.S. Census Bureau to produce the current borough and census area estimates. The Census Bureau's estimates were computed by an average of two techniques: Regression and Component Method II. These Bureau estimates also include estimates for boroughs and census areas conducting a full census by the approved Housing Unit Method which overrides both techniques. The Census Bureau's borough and census area estimates are controlled to the Census Bureau's State estimate. Our borough and census area estimates are similarly controlled to our State estimate.

Both Alaska and the Census Bureau use the same regression equation in estimating the population for census areas, using changes in school enrollment and births to predict population change. In the Regression method, a multiple regression equation is used to relate changes in the distribution of a number of different data series to changes in the distribution of population among areas. For both the development of the regression equation and the computation of the population estimates, the data for all variables are transformed by calculating ratios of percentage shares in the later year to corresponding percentage shares in the earlier year. These transformations cause the resulting coefficients in the prediction equation to add approximately to 1.0. The series of data used in the Regression method for Alaska are a dummy variable for major cities (X1), medicare enrollees (X2), school enrollments in grades 1 through 8 (X3), a 3-year average of resident births (X4), and a dummy variable for areas less than 5,000 population (X5). The regression equation for Alaska is given by

$$Y = 0.207 + 0.055(X1) + 0.046(X2) + 0.408(X3) + 0.297(X4) - 0.032(X5)$$

The Alaska Department of Labor's Administrative Records method is essentially the same as the U.S. Census Bureau uses for other states. That is, to the base population minus group quarters is added the balance of births and deaths and an estimate of migration based on reported IRS migration. To this is added new group quarters to produce an initial estimate. This estimate was then adjusted based on borough and local censuses. The one additional step in Alaska's borough and census area estimates involved an additional adjustment of the borough and census area totals after initial place and rural balance estimates were produced. The totals for some census areas were adjusted upward because a reasonable set of place estimates could not be produced from the initial census area estimate. The borough and census area estimates were again adjusted to the state total to produce the final estimates.

Component Method II uses reported births and death statistics to measure net natural increase but relies on school enrollment to measure net migration. The estimates produced by Component Method II are specific to the population under 65 not residing in group quarters. To this population is added an estimate of the population 65 and over based on the change in Medicare enrollees from 1980 to the estimate date, the institutional and college populations, and the reported military populations living in barracks.

IV. Population Estimates for Places
1983-1984

Introduction

This section contains revised place estimates for July 1, 1983 and provisional place estimates for July 1, 1984 for all incorporated places, census designated places (CDP's), and the rural balances of both census areas and census subareas. Place estimates are presented here in three forms: by census area, by rank order by size, and alphabetically. These are found in Tables IV.1, IV.2 and IV.3 respectively. While revised estimates for July 1, 1982 and 1981 are needed to produce a consistent series back to the 1980 census, resources did not allow their completion in time for inclusion in this volume of the Overview. A complete series is currently slated for development during the next year.

Characteristics of Places

Selected characteristics for Alaska's incorporated places, census designated places and rural balances are presented from the 1980 Census in Table IV.4. In addition to the total population, the population in group quarters is listed, the number of housing units in 1980, the vacancies and the persons per household. Other characteristics of the communities shown are the number and percentage of females in the community, the number and percentage of Native Americans in the community, and the number and percentage of families found in each community.

One generally thinks that there are fewer families in a frontier environment, but this is not the case for Alaska. Nationwide, 73.3% of all occupied housing units are occupied by families of two or more persons related by blood or marriage. In Alaska, that percentage was 72.7% in 1980. There are, however, a number of communities which tend to have a large proportion of single persons. These are often military or oil related installations that are composed entirely of men in barracks. Examples of this phenomenon in 1980 are found at Shemya Station in the Aleutians, and Deadhorse and Prudhoe Bay on the North Slope.

In 1980 , Alaska had at least 25 communities with less than 50% family composition. Half were completely group quarters. Most of the rest are small communities that specialize in logging, mining, or seasonal activity such as tourism. Another 26 places or rural balances had between 50-59% family composition. The largest community of this sort is Unalaska with some 600 persons in group quarters and only 51% of the occupied housing units occupied by families.

Predominantly Native communities differ significantly in characteristics from predominantly non-Native communities in Alaska. In 1980, there were 147 places which were 75% or more Native. On average, these communities were approximately 90.0% Native. The population of these places totaled 36,161 or 9.0% of Alaska's Population. Alaska Natives living in predominantly Native communities made up 50.9% of all Alaska Natives. In 1980, among these communities, there were only three with over 1,000 persons: Metlakatla (1,056, 85.6% Native), Kotzebue (2,054, 76.6%), and Barrow (2,267, 75.9%). Excluding these three larger communities, Alaska's predominantly Native communities averaged 214 people living in 50 Occupied Housing Units with 4.14 persons per Housing Unit. On average, each of these communities had 7.8 vacant housing units for a 12.7% vacancy rate. These communities were very family oriented with 92.2% of the households occupied by families and 46.1% of the population being female.

In contrast, the least Native areas of the State included 134 places and/or balances of census areas with less than 25% Native population. Thirty such places or rural balances were larger than 1,000 persons in 1980. These include: Kodiak Station CDP (0.6% Native), Eielson AFB CDP (0.7%), Adak Station CDP (0.8%), Fort Greely CDP (0.9%), North Tongass Highway CDP (2.4%), Homer (3.0%), Soldotna (3.1%), Balance of Kenai-Cook Inlet CSA (3.2%), Palmer (3.5%), Balance of Matanuska-Susitna Borough (3.7%), Nikiska (4.0%), Balance of Fairbanks North Star CSA (4.4%), Wasilla (4.7%), Anchorage (5.1%), Valdez (5.7%), Kenai (6.1%), Fairbanks (7.0%), Balance of Kodiak Is. CSA (9.5%), Balance of Southeast Fairbanks CSA (9.7%), College CDP (9.8%), Balance of Copper River CSA (12.7%), Petersburg (11.1%), Juneau (11.2%), Seward (12.9%), Kodiak (14.0%), Ketchikan (14.6%), Unalaska (15.1%), Cordova (15.2%), Wrangell (17.9%), and Sitka (21.4%).

If all places and areas with less than 25% Native population in 1980 were treated as a single place, it would have contained 350,080 persons or 97.0% of the States non-Native population. The Native population of this place would be 22,480 or 6.4% of the area total. The Native population would total 35.1% of all Alaska Natives. In contrast, only 3.0% of Alaska's non-Native population lives outside of this hypothetical place. This place contained 138,583 Housing Units, 14.7% of which were vacant. This place would also have 72.2% of its occupied housing units occupied by families and have an average of 2.83 persons per Occupied Housing Unit. The percent of the population which was female was 47.1%.

The remaining 46 places and rural balances contained 15,610 persons. These places contained between 25-74% Alaska Native. On average, 57.8% or 9,018 of those persons in these places were Alaska Natives. Approximately 14.1% of all Alaska Natives lived in these places. The only communities over 1,000 in this category were Dillingham (57% Native) and Nome (57%).

Methods

Local Census and Surveys

As with the Census Bureau estimates, place estimates are controlled to estimates for census areas and the State. In both the Census Bureau estimates and Alaska Department of Labor estimates there are conditions under which smaller area estimates may override census area estimates.

These conditions are met when a boroughwide census has been taken according to the requirements as set by the U.S. Census Bureau and the Demographic Unit of Research and Analysis, Department of Labor. These requirements are that the local census must follow the U.S. Census Bureau procedure for doing full enumerations or Housing Unit Method estimates. Research and Analysis provides training in the census methods and the census must be reviewed by the Alaska Department of Labor.

In addition, the U.S. Census Bureau and the Alaska Department of Labor generally accept full population rosters of small places as acceptable censuses when all households are listed along with the listing of all currently resident family members (See Chapter V.1). These household census lists are most likely to be acceptable if accompanied by a map showing each village Housing Unit by number with the residents of each household numbered.

Usually sample surveys or local estimates are not accepted by the Alaska Department of Labor. The Department may accept all or part of the information from such a survey, if it follows the Housing Unit Method for producing local population estimates and the estimate is corroborated by our independent estimates, or if the sample survey methodology has been reviewed by the U.S. Census Bureau for federal revenue sharing purposes and found to be acceptable. For example, we currently accept the results of the Anchorage sample survey because the sample methodology was reviewed and found acceptable by the Statistical Standards Division of the U.S. Census Bureau for 1982 federal revenue sharing purposes.

As part of our 1984 estimates, we accepted the State revenue sharing estimates for Fairbanks, Wrangell and Petersburg because their estimates fell acceptably close to our own independent estimates.

Where there were accepted local censuses during the 1980's, these served as a starting point for place estimation. In 1984, 65 (or 44.8%) of the 145 Alaska municipalities and the Kenai Borough conducted local censuses, had acceptable Housing Unit Estimates, or provided population rosters. Another additional 31 municipalities (or 21.4%) and Ketchikan Gateway Borough had such acceptable estimates in 1983. Kodiak Borough and 14 of the remaining municipalities (or 9.7%) had acceptable estimates in 1982. Of the remaining communities, 9 municipalities (or 6.2%) had acceptable estimates for 1981.

All tolled, 82% of the places in Alaska have taken a local censuses, done acceptable Housing Unit Estimates or provided population rosters at least once since the 1980 Census, and some communities have updated such estimates annually or biannually. In addition, five boroughs have conducted full censuses since 1980 and Anchorage has conducted an acceptable Housing Unit Survey each year. The largest incorporated places which were exceptions as of July of 1985 were: Juneau (23,729), Sitka (7,611), and Bethel (3,681).

If a community has had at least one such census, revised estimates for intervening years can be linearly interpolated from the known census. This technique was used for a number of communities in revising many 1983 estimates and will be used in revising numbers for 1984 next year.

The majority of place estimates were computed from change in school enrollment ratioed to either the 1980 census base or a more recent census. This was particularly useful for many incorporated places and CDP's which had their own school districts. In boroughs such as Kodiak, Kenai, Fairbanks North Star, and Matanuska-Susitna which had boroughwide school districts, these estimates were of limited value for estimating places. They still were of use in confirming overall census area growth. Of these areas, however, Kenai and Kodiak have had recent censuses, and Fairbanks, North Pole and Palmer had acceptable estimates for 1984. Only Houston and Wasilla had to be estimated by boroughwide proportional growth based on their respective 1983 and 1982 estimates.

There are a number of weaknesses in using education based ratio for some places. Communities which are composed primarily of single adults, such as logging camps or fish canneries, may have populations which change independently from the number of local families. Also, for places with very small numbers of children, the variation of one child produces too much variation in the estimate for this technique to be usable. All place estimates where the size or the age/sex composition of the place may have changed drastically since 1980, or where the numbers are extremely small, or where education statistics are incomplete or inaccurate, may have estimates of lower reliability based on education ratio's.

In virtually all cases, the estimate for the rural balance of a census area was not allowed to fall below that suggested by the education ratio.

Where there were no education statistics communities were assumed to grow by a constant proportions technique. This technique assumes that the place is proportionately sharing the growth being experienced by the census area as a whole. In the case where some communities were known and some unknown, the population remaining after the estimation of the known communities were proportionately distributed among the remaining communities.

Estimates for Census Designated Places

This is the first time that estimates of this detail have been attempted in *Alaska Population Overview*. Census designated places are unincorporated places generally of more than 25 persons in 1980. There are probably some places larger than 25 which were missed in 1980 and which are currently larger than some CDP's listed here.

In producing these estimates, we have a varying level of confidence in the estimates of the CDP's. Confidence ranges from a fairly low level of confidence in the estimates for the CDP's in Matanuska-Susitna to a fairly high level of confidence in the estimates for CDP's on Kenai where there was a recent borough wide census.

In general, we have allowed these places to proportionately share the growth of the rural balance of the census areas. Some CDP's for which school enrollment data were available were estimated by the change in the ratio of school enrollment to population from the 1980 Census to the estimate date. Since CDP's have no incorporated boundaries, the limits of the settled area are only approximate. The model is currently being improved through the expansion of our indicator data series, which should improve our ability to track the population of small rural places in future years.

Alaska has several large CDP's which are bigger than many of the incorporated cities in the state: Eielson AFB (7,837), College (4,765), and Adak Station (3,169) would meet the Census Bureau's definition of an Urban Place. Several others, such as Kodiak Station, North Tongass Highway (Ketchikan Gateway), Fort Greely, Bodenburg Butte (Mat-Su), Sterling (Kenai), Fritz Creek (Kenai), and Nikishka (Kenai), are estimated to have between 1,000 and 2,500 population. Such places are generally ripe for annexation or incorporation and most will probably not be CDP's by 1990.

Expansion and testing of population indicators and further testing of the model for place estimation is an ongoing process and should continue to result in improvements in our place estimates in the coming year.

Alaska Department of Labor, Research & Analysis, Demographic Unit, 1985.

Footnotes

1/ Cold Bay was not incorporated until 1982. The 1980 figure represents Cold Bay as a "Census Designated Place."

2/ Saint George was not incorporated until 1983. The 1980 figure represents Saint George as a "Census Designated Place."

3/ In 1980, Nunapitchuk and Kasigluk were not incorporated and were known by the single name of Akolmiut.

4/ Chignik was not incorporated until 1983. The 1980 figure represents Chignik as a "Census Designated Place."

5/ The Eielson Air Force Reservation was annexed to the Fairbanks-North Star Borough in early 1983. Its population is included in the Borough total. Prior to this year Eielson's population needed to be subtracted from the Borough's total to obtain the Borough population for its legal boundaries. Historically, most population figures included Eielson as if it were part of the Borough.

6/ In 1980, it appears that the U.S. Bureau of the Census incorrectly defined the boundary of the city of Kachemak and counted people who were actually outside of Kachemak as part of Kachemak's population.

7/ 535 is a corrected 1980 census figure for Selawik. The original, incorrect number released by the U.S. Bureau of the Census was 361.

8/ Subsequent to the 1980 census, the Kodiak Island Borough annexed the Kodiak Island Coast Guard Station. Both the 1980 and 1983 figures reflect the presence of the Coast Guard Station population in the total borough population.

9/ In 1982, Nome annexed the unincorporated "place" of Icy View, which had 210 residents. Further in 1980, the U.S. Bureau of the Census used boundaries for Nome that were later expanded legally. The 1983 figure for Nome reflects both the population of Icy View and the expanded boundaries.

10/ Atqasuk was not incorporated until 1983. The 1980 figure represents Atqasuk as a "Census Designated Place."

11/ 2,267 is a corrected 1980 Census figure for the city of Barrow. The original, incorrect number of 2,207 released by the U.S. Bureau of the Census reflected a mis-allocation of 60 persons into an area outside of the city of Barrow.

12/ Thorne Bay was not an incorporated city in 1980, it was a "Census Designated Place" with a population of 377, which is the figure shown for 1980. Thorne Bay incorporated in 1982.

13/ St. Mary's population increase is partially due to an annexation in 1981 of Andreafsky into the incorporated city.

* Indicates a census conducted in accordance with procedures contained in *Standards for Conducting a Census in Small Alaskan Cities.*

** Indicates a census conducted in accordance with procedures contained in *Alaska Census Administrator's Manual* and *Alaska Census Enumerator's Manual.*

V. Special Reports

V.1 Local Area Census Program

Local Area Census Program

by Jo Van Patten
Representative, Federal-State Cooperative for Population Estimates

With the passage of the State and Local Fiscal Assistance Act (P.L. 92-512) by Congress in 1972, population data became more important. In that act Congress tied population numbers to dollars. They specified current population figures as one of the data elements in the formula for allocating general revenue sharing funds. Since 1972, population data has become widely used for other funding allocations and program criteria as well as for planning most projects. In FY 83 366,618,860 federal dollars were allocated to Alaska using population as a basis for distribution. Similarly, the state's revenue sharing formula for all governmental units also includes population as one of the data elements. In FY 83 the Department of Community and Regional Affairs disbursed $55,721,000 to communities throughout the state using their specific formula.

The Department of Labor administers a local census program as one method for communities to determine their population for a given point in time. The residency and housing definitions are identical with those used by the U.S. Bureau of Census (Table VI.1, VI.2). The methods of conducting a local census as well as the definitional concepts have been reviewed by the Census Bureau, and are in conformance with theirs. Consequently, the U.S. Bureau of Census accepts the results of a local census which has been administered and certified by the Department of Labor for federal revenue sharing projects and for use in their county statistics program.

The census program administered by the Department of Labor is organized to insure that every resident in a given area is counted and counted only once. Accurate maps of the existing streets in the locality are critical. If the local planning department does not have these available, census personnel construct working maps for their own use during the census. These maps show only existing streets. Once a city (borough) has been mapped, it is then divided into clearly defined working areas called blocks. These can be grouped so that the municipality may obtain population figures for specific areas, such as service areas, ambulance service areas, or election precincts. The data needs of the community are a prime consideration.

Enumerators (interviewers) and supervisors are thoroughly trained by Department of Labor staff in the concepts of residency and housing before starting work. Very specific work areas are assigned and all work is checked every evening. Names are taken to insure that no one is counted twice and as a means of checking completeness of coverage. If no one can be contacted in a specific housing unit, as a last resort, information can be taken from neighbors. Tabulations are checked and cross checked to insure accuracy.

The data which result from a census include housing units by structure type, vacancies by structure type and population by structure type. Structures or housing units are categorized by the number of units they contain—single family, duplex, 3 units, 4 units, multiple units of five or more, mobile homes and trailers. It is possible to determine how many persons live in mobile homes versus single family units, where most vacant units are, what type of unit has the highest vacancy rate or where housing is of short supply or overbundance. Population figures can be reaggregated around almost any focal point in the municipality for school purposes, liquor licenses or any planning need.

No information is gathered on commercial structures unless there is someone living on the premises. Then it is considered a "housing unit", and will be tabulated as such.

Since the Local Area Census program was established in 1981, many communities have taken advantage of this means to obtain an accurate count for their area. Table V.1.3 lists the cities and boroughs which have conducted a census, the number of persons and housing units counted and the cost per person counted where available. Wrangell was used as a test site when the program was established. Their costs were not tabulated because of this. Each municipality did their own hiring, and set their own rates of pay. The geographic setting of each locale directly influenced their costs as did the number of staff persons and municipal facilities which were utilized. For example, Kenai, due to its large land area, had four separate offices to direct census activities, each specific to a particular locale. Ketchikan, a very compact community, had a minimum of outlying (expensive) places to reach. They were also able to use a municipal building for office space. Fairbanks city contracted their census to a consulting firm.

Small communities may do a census on their own using census methods adapted to their smaller geographic situation. The procedure is simple. The residency and housing unit definitions remain the same. A map depicting streets, buildings and natural boundaries must be drawn. The housing units are numbered methodically. A list, by housing unit number, is then made of all the **residents** of the community. Total number of residents is tallied. Both map and resident lists must be submitted for census certification. Many communities annually submit just such information to the Department of Community and Regional Affairs for revenue sharing. Figure V.1.1, V.1.2 show the maps used by Newtok and St. George to ascertain their population as of July 1, 1984.

Any small local census done in this manner may also be submitted to the federal government for use in their revenue sharing program. A manual, *Standards for Conducting a Population Census in Small Alaskan Cities,* is available from the Department of Community and Regional Affairs, Division of Local Government Assistance or contact Jo Van Patten at 465-4500 at the Department of Labor.

While revenue sharing is the prime motivation for doing a census, there are many other uses for this data once it has been collected. Population growth data is essential in almost any planning process whether it is planning for streets and land development, electrical service, hospital services or library services. A by-product of the statewide population program is the formation of a cadre of persons knowledgeable in census definitions and methodology. By the time the 1990 decennial census occurs this background will be invaluable in challenging any apparent discrepancies in that count and getting them corrected while field people are still available. Statistics derived from the federal decennial censuses are used for the ten years following each count, and many times even longer. It is in the best interest of each community to have the most accurate and reliable data tallied and on record.

Table V.1.1
Housing Unit Rules

A housing unit consists of one or more rooms intended for occupancy as separate living quarters. Occupants must live and eat separately from everyone else in the building, **and** have direct access from the outside of the building or through a common hall, **or** have complete kitchen facilities for their household only. Complete kitchen facilities must include sink with piped water, a range or cook stove, and a mechanical refrigerator. Several types of housing structures are counted as housing units if they are occupied by residents, but are not considered housing units if they are empty.

1. Occupied Housing Unit

   A housing unit is occupied if a household of one or more **resident** persons usually lives and sleeps there.

2. Vacant Housing Unit

   A housing unit is vacant if it is without occupants or if it is temporarily occupied by persons who are not residents of the city if it is a city census, or residents of the borough if it is a borough census. A unit from which the occupants are temporarily absent (on a vacation, etc.) is **not** considered a vacant unit.

   a. Housing Structures not Considered Housing Units if Vacant

      Several types of housing structures are **not** considered housing units if they are **not occupied.** These include:

      Delapidated housing structures not considered fit for human habitation

      Housing units obviously being used for storage

      Houseboats

      Tents

      Other objects or structures not originally intended for living quarters which may occasionally "house" someone—automobiles, packing boxes, caves

   b. Housing Units under Construction

      Housing units under construction with a roof, exterior doors and windows, and final useable floors should be counted as a vacant unit if they are not occupied.

Table V.1.2
Residency Rules

The table is divided into two columns. The type of person (student, member of the armed forces, etc.) is described in the left-hand column. The right-hand column tells you whether the person is a resident of the household you are enumerating, or some other place.

	Type of person	Resident of--
1.	Lives in this household but is temporarily absent on a visit, buisness trip, vacation, in connection with job (bus driver, traveling salesman, river vessel crewman, etc.) or subsistence (working in fish camp for the summer)	This household
2.	Lives in this household on weekends only. Works most of the week in another place and maintains a room or apartment there	The other place
3.	Lives in this household but is in a general or VA hospital, including new babies in the hospital who have not yet been brought home	This household, (unless in a psychiatric, TB, chronic ward, etc.; if so, count in the hospital)
4.	Member of the Armed Forces:	
	a. Living on military installation	The military installation
	b. Stationed on nearby installation but living off post in this household	This household
	c. Assigned to a military vessel (including Coast Guard)	The vessel. If a military vessel is at dock in your area the crew living on the ship are considered residents of the ship and should be enumerated.
5.	Officer or crew member of American merchant vessel engaged in coastwise, intercoastal, or foreign transportation (including Great Lakes)	The vessel. If an American merchant vessel is located in your area the crew is considered residents of the ship and should be enumerated.
6.	Officer or crew member of a merchant vessel engaged in inland waterway transportation	This household
7.	College Student	
	a. Away at college on census day or here only on vacation	The college area where he/she is living
	b. Attending college but living in this household while attending school	This household
8.	Student away attending school below college level such as boarding school at gradeschool or high school level (not students at institutional-type schools)	This household
9.	Nurse living in hospital, nurses home, etc.	Hospital, nurses' home
10.	Persons working and living away from home. This includes construction workers, linemen, etc. who routinely spend 4 or more nights a week, or extended periods away from home at work sites	The place where they live while working away from home

Type of Person	Resident of--
11. Person who has more than 1 home and divides time between them. (Vacation and summer homes are a good example.)	The place where he spends the largest part of the calendar year
12. Person who has more than 1 home and divides their time equally between them	This household
13. Person who is a skid road type transient with no usual place of residence	The place they are found at the time of the census
14. Person who lives in household during the day such as a babysitter or housekeeper but sleeps at their own residence at night and on their days off	The place where they sleep
15. American citizen abroad:	
a. Temporarily on vacation or away in connection with his work	This household
Employed by U.S. Government with place of duty abroad or member of the family of such a person living with them	DO NOT COUNT
c. Any other American working or living abroad for an extended period of time	DO NOT COUNT
16. Person in institution where people usually stay for long periods of time such as penitentiaries, jails, workhouses, reformatories, convict camps, schools for delinquents; mental institutions; homes for needy or aged; hospitals and asylums for the chronically ill and handicapped; homes for the deaf, blind, or mentally retarded, regardless of length of sentence or stay	The institution
17. Member of religious order living in a monastery, convent, etc.	The monsastery or convent
18. Persons in places which have shifting populations composed mainly of persons with no fixed residence, such as convict camps, railroad camps, highway and other construction camps, and camps for migratory agricultural workers	The camp
19. Citizen of foriegn country:	
a. Studying or working in the U.S. or members of family of such persons living with him	This household
b. Temporarily traveling or visiting in the United States	DO NOT COUNT
c. Living on the premises of an Embassy, Ministry, Legation, Chancellery, or Consulate	DO NOT COUNT. Do not enter these premises.
20. Domestic servants who "live in"	Determine if the servant occupies a housing unit separate from the main household. If NO, list with the household members. If YES, enumerate as resident of their own household.

Population Census
MAP - 1984

Residence as of Official Census Date

The Official census date is usually July 1, but may differ as many special censuses are conducted at other times of the year. All persons living as 12:01 a.m. on the census date must be counted. Babies born after 12:01 a.m. and persons dying before 12:01 a.m. should not be counted. Similarily, persons moving **in** after that time are not counted as residents, nor are those moving **out** before that time.

V.2 Planning the 1990 Census in Alaska

Planning the 1990 Census in Alaska

By Kathryn Lizik, State Data Center Coordinator

Getting a National Census Started

Every 10 years the Census Bureau conducts a head and housing count as authorized by the U.S. Constitution and Title 13 of the U.S. Code. The constitutional mandate for a decennial census is to ensure each seat in the U.S. House of Representatives is apportioned by nearly equal population sizes. The census, however, provides much more than just population counts. Federal, state, and local governments, nonprofit organizations, and private business have all come to depend on the broad array of social and economic statistics also made available from the census. The data are used extensively for planning and decision making, maintaining efficient operation, and insuring a fair distribution of resources among the nation's people.

Planning for an operation the size of a decennial census requires a very long lead time. The first step is usually review of the prior census. In 1982, the Anchorage based Institute of Social and Economic Research evaluated Alaska's portion of the 1980 census. The report indicated major improvements were needed in the areas of census geography, training of enumerators, and public outreach and education.

Federal level planning started in 1983. The Census Bureau began their preparatory work with a full examination of the 1980 census and continued by establishing general timetables and initiating several testing activities. It is hoped these preliminary steps will help avoid many unforeseen problems which occurred in 1980. Issues such as questionnaire content and adjustment methodology reflect some of those problems. Others dealt with poor maps, difficulties with training and retaining enumerators, and funding shortages.

Improvements the Bureau hopes to implement in 1990 include: greater solicitation of user feedback through public meetings; reduction of costs while maintaining data quality; maintenance of publication release deadlines; incorporation of more automation into the collecting and processing of census information; and maintenance of a high level of accuracy.

Part of the 1990 census process will involve the use of Federal State Cooperative programs found in each of the fifty states. The programs insure a greater degree of state input at not only the preparatory stages but also the review end. The Alaska State Data Center and the Federal State Cooperative for Population Estimates, located in the Demographics Unit of the Alaska Department of Labor, Research and Analysis, will both be working closely with the U.S. Census Bureau in planning for the 1990 census in Alaska. Emphasis of the two cooperative programs will be on solicitation of information and guidance from Alaskan communities to insure adequate local review before, during, and after 1990.

Choosing Questions for Census Content

After evaluation of the 1980 census comes the selection of questions to be asked on the 1990 census. These questions must be made final and reviewed by Congress by 1988. Two types of census questionnaires were used in 1980, the short form and the long form. The short form (100 percent or complete count), contained 19 questions. It was delivered to every household and required answers by every U.S. citizen.

The long form (sample count) contained 46 additional population and housing questions. These questions were asked of 17 percent of all housing units nationwide and 50 percent of those in incorporated places of 2,500 or less.

Putting together a census questionnaire requires consultation with thousands of people to make sure the best questions will be included. Among the groups which review and make suggestions are the Federal Agency Council for Demographic Censuses, the American Statistical Association, the American Marketing Association, and the American Economic Association. Additional input is received from other academic and business groups, state officials, geographers, and computer analysts. The Bureau also sought comments on questions from the general public through Local Public Meetings. Alaska hosted two during June of 1985. These meetings gave interested persons the opportunity to critique the prior decennial census, and to suggest improvements in questionnaire content and procedures for the next.

Far more questions were suggested during these consultations than could be incorporated onto the questionnaire forms. In fact it is highly unlikely the total number of questions chosen for the 1990 census will increase over those of 1980. Additional questions are costly and tend to increase the burden on those answering, lowering the response rate. Usually questions must be deleted for new ones to be added.

Preparation of census questions also requires editing to insure clarity. It is important that questions be worded in such a way so as to elicit the same response by as many people as possible. The wording of questions like every aspect of census preparation is tested in select communities.

Census Geography

Another planning step towards census day is the proper delineation of geographic boundaries, preparation of maps, and improving the technology used for assigning census data to a proper geographic area. Over 40 different geographic areas exist for tabulating data, ranging from a block to the nation as a whole. All are categorized according to two basic boundary types: Political (legal) boundaries and statistical boundaries. Political boundaries are usually represented by governmental units such as states, boroughs/census areas, cities, and Alaska Native Villages, or administrative units such as congressional districts or election precincts. However political boundaries do not always define the most meaningful area for conveying economic and population data. To compensate, statistical boundaries were created which classify areas by size and function. Examples include Metropolitan Statistical Areas (MSA), tracts, blocks, census designated places, and enumeration districts. All boundary types are subject to review, revision and change.

Four principal surveys provide the Census Bureau with legal boundary changes for municipalities, Federal and State Indian Reservations, congressional districts, and election precincts. The Boundary and Annexation Survey is done annually in January. Boundary information for Indian reservations is obtained from the Bureau of Indian Affairs or an appropriate state agency prior to a decennial census. Information on changed congressional districts is received after decennial censuses. And election precinct boundary changes are available three years before census day from states participating in the P.L. 94-171 program. Boundary changes in other areas are solicited by contacting the proper government authorities.

Maintaining the inevitable changes inherent to political or statistical boundaries is a monumental task. To illustrate, the State of Alaska alone added 212 new Native Village boundaries prior to 1980 as a requirement of the Alaska Native Claims Settlement Act. Since 1980 more changes brought the incorporation of seven places, disincorporation of one, three annexations, and the redrawing of the states 27 election districts.

Responsibility for reviewing, or changing, most statistical boundaries lies with the Census Bureau. However the bureau usually works closely with local offices and organizations to insure boundaries meet user needs. Census Statistical Area Committees (located in Anchorage and Fairbanks) delineate census tracts. The deadline for proposed changes effective for the 1990 census is June 1986. Metropolitan Statistical Areas on the other hand are defined by the Office of Management and Budget, Executive Office of the President. Alaska has only one Metropolitan Statistical Area, Anchorage.

Effective in 1985, the Alaska Department of Labor was delegated the responsibility to choose block group and block numbering area boundaries for 1990. The due date for this project is June 1986.

Another 1990 geographic planning activity is the blocking and map digitizing of the nation. Recognized as the Block Boundary Suggestion Program, the incentive behind this project is to improve population reporting for State legislative redistricting. Blocks will become the basic building component upon which all statistical boundaries and some political boundaries may be based. Blocks will replace the prevalent enumeration district boundaries providing greater consistency with which to aggregate and compare data over time. State participation in this program was also delegated to the Alaska Department of Labor, with a due date of June 1986.

Coupled to the blocking program is the development of a new geographic reference file called TIGER. Every state will have its geographic boundaries digitized into a database from which a broad range of map sizes containing any specified boundary can be created. A further product will be tabulations of data for any unit whose boundaries have been recorded in the file.

Public Awareness

At the same time questionnaire and geography planning are taking place, so is emphasis on ways to obtain public cooperation. Achieving the best count possible depends on a high level of public awareness and support. Although no decennial census has ever successfully recorded every person, several factors have been identified which contribute to the prevailing undercount: suspicion, fear, mobility, apathy, and carelessness. To counteract these factors, several plans for coverage improvement have been devised to increase public cooperation. Pre-canvass operations, movers checks, vacancy checks, and local review name just a few. Since the undercount however, has historically been found to include larger percentages of minority populations, much of the coverage improvement efforts have been directed towards those racial and ethnic groups. Bilingual interviewers, Spanish questionnaires, and the Minority Statistics Program made huge inroads during 1980.

Although heaviest media emphasis on public awareness takes place during the months immediately prior to the census, numerous other informational and outreach meetings are scheduled as early as six years before. Census Tables, Local Public Meetings, Census/Community Network Meetings and geography reviews, all bring the importance of decennial censuses to the public's attention. Alaska hosted at least one of each of these meetings during 1984 and 1985. Census/Community Network Meetings will continue biannually through 1990.

How the Census is Taken

The field operation associated with collecting census data has gone through several evolutions during the last decades, with the 1980 procedure expanding use of the mail-out/mail-back system to over 90 percent of the nation's population. The mail-out/mail-back procedure sends both the short and long form questionnaires directly to pre-listed addresses, requesting return of the questionnaire in an enclosed envelope. The increased use of this system resulted from better responses, better checks of the mail census address lists, and better controlled sampling of housing units answering the long form. In Alaska however conventional door-to-door canvassing took place in 1980. In this case, short-form questionnaires were distributed to postal patrons in urban areas, and enumerators picked them up. Sample questions were asked at every sixth or second housing unit, depending on the sampling rate for the area. In outlying areas, enumerators concurrently listed housing units and conducted short form and sample interviews.

Although no final decisions have been made yet concerning changes in Alaska's enumeration process for 1990, the success of the mail-out/mail-back system may influence the bureau to expand its use to some of the larger urban areas of the State.

Because the census occurs every ten years, it is inevitable the huge work force hired to take the census will only be employed for a few weeks. Each temporary district office employs more than 500 persons, covering jobs from district office manager to supply clerk. However the bulk of workers are field enumerators. Each applicant is required to fill out an application form and take a job-related test that measures their knowledge, skills, and abilities for census work. Since the recruiting effort is so massive, emphasis is directed towards community involvement to help fill the temporary jobs.

After the initial enumeration has ended, several stages of follow up begin in mid-April to double check vacant units, nonresponse addresses, and rejected questionnaires. Both telephone follow-up and housing unit visits are necessary. This final collection phase, usually completed by early June continued well into August for Alaska.

Interspersed throughout the above census operations is the enumeration of nonroutine housing units called special places. Special places include military bases, crews of vessels, hospitals, prisons, universities, parks, resorts, mobile home parks. Special census forms are used which exclude most housing related questions.

Local Review

The final step of the collection phase is local review. The review is conducted for the lowest level of geography for which housing counts are available. The purpose of the review is to give local officials the opportunity to identify major discrepancies between census bureau counts and locally derived estimates. In those parts of the country where the mail-out/mail-back system is used, two reviews are scheduled, a pre-census and post-census. In Alaska where the conventional census took place, only the post-census local review is scheduled.

Local review, though good in concept, does not always provide the results intended. The only information available to many local officials for comparing their counts to the bureau's are building permits, utility connections, or tax records. Since this information is often lacking a quality review is often not possible. Another impeding factor is that local officials may not be trained or experienced in the review process.

The census bureau in conjunction with the Alaska State Data Center and Federal State Cooperative Program for Estimates are tentatively planning training seminars for local officials between 1987 and 1989. Emphasis on establishing records of housing units prior to the census would be a major training consideration.

Processing and Coding the Data

With the conclusion of the local review program, the actual data collection phase comes to an end. Alaska's ended October, 1980. As field and district offices close, all census questionnaires and other related census materials are shipped to a processing center. The questionnaires are first microfilmed, then an optical sensing system transfers the information onto computer tape. When the tabulations are finished, the original paper questionnaires are destroyed. The microfilm is sent to the Age Search Service office in Kansas. The computer tapes become the basis for preparation of the remaining data products.

Although improvements to the processing method are certain to take place, no specific changes have yet been selected for 1990. Since much of the paperwork is still handled manually, the Bureau is testing several computer systems which should further automate both data collection and handling. It is anticipated completed questionnaires will be sent to processing centers earlier, avoiding the massive mailing of a region's entire census questionnaire collection.

First Counts Available

Because the Census Bureau is legally required to provide the President with official State population counts by January 1, the year following the census, preparation of the 100-percent data is given priority. The Bureau must also provide each State with detailed population counts for their redistricting by April 1, the year following the census. An additional factor behind priority processing of 100-percent data is its need for establishing weighting controls for inflating sample responses. Following release of the mandated population counts, attention turns to preparation of the other data products.

Data Products

The final step of every census is the release of the many data products created from the 100% and sample questions. Printed reports, microfiche, summary data on computer tapes, maps, and special tabulations reflect the range of products available. When selecting a product users should keep the following in mind: the larger the geographic area, the more detailed the data will be. Almost any statistic is tabulated at the national level, only 100-percent population counts at the block level. Other considerations might involve cost, ease of access, time of product availability, and suitability of extensive use. Summary tape files always contain the most data, at the most detailed level. However tapes are more expensive and require access to mainframe computers. Printed reports provide a more low cost and easy reference for looking up data, but contain much less geographic and social or economic data.

The report series are organized into three major groups: population, housing, and population/housing. Normally the first released reports are preliminary, followed by the advanced series, and the final. Reports are further differentiated by either containing complete count data or sample data.

Two types of microfiche were generated from the 1980 census: microfiche covering the report series, and microfiche presenting data from selected summary tape files.

Five public use files referred to as summary tape files 1 through 5 were generated offering data on numbers of persons, families, or housing units distributed by their various characteristics.

V.3 Migration to and from Alaska

Migration to and from Alaska

By Greg Williams, State Demographer

Beginning in 1984, Alaska has at its disposal for the first time new information on migration. This new source is Internal Revenue Service migration statistics. While these statistics have been available to the U.S. Census Bureau for some time and have aided in the generation of Census Bureau estimates, only recently have they been released to the states. Their availability has significantly improved our ability to track the illusive migration component of population change.

While the United States has a birth and death registration system, there is no registry of information on the movement of people from one place in the U.S. to another within the country. Where there is rapid population growth, well over half of the growth is frequently accounted for by migration as opposed to natural increase in the form of births and deaths. The lack of accurate migration indicators is, therefore, the most important single factor in the inaccuracy of population estimates.

The basic balancing equation for computing population as shown below is quite simple.

$$P2 = P1 + (B-D) + (IM-OM) + e$$

where:

P2 = The population estimate or count at the end of some time period.
P1 = The population estimate or count at the beginning of some time period.
B = Births reported during the time period.
D = Deaths reported during the time period.
IM = In-migration estimated during the time period.
OM = Out-migration estimated during the time period.
e = Error from all sources.

Frequently, net migration is computed as a byproduct of the population estimation process rather than an input into a population estimate. This is the case when migration and migration rates are computed as a residual. The population is counted or estimated at two points in time. From the difference in these populations is subtracted the natural increase (births-deaths) and the remainder is assumed to be the net migration. Residual migration is a passive component under these circumstances.

In addition, residual net migration also contains any error which exists in any number in the equation. This can be in the form of census error, estimation error, or incomplete birth or death registration. While birth and death registration is virtually complete at the state level, geographic coding error may increase the degree of error for smaller geographic areas such as boroughs or census areas.

In addition, census error in 1980 may be at least five percent in Alaska and the difference in error between the 1970 and 1980 censuses may be on the order of two percent. If the level of residual migration is four percent, it is quite possible for the estimate to reflect as much error as migration. Nevertheless residual net migration has been and still is extensively computed, reported, and used in part because there was nothing better and because the degree of error is assumed to be constant over time.

IRS Migration

The availability and use of Internal Revenue Service data allows an independent indicator of migration to be computed. Tabulating the data for IRS migration requires the comparison of about 90 million income tax return records for two years. Returns with changes of address are tabulated by county of origin and destination. The result is a matrix of over 3,141 by 3,141 counties, or county equivalents, with the total number of no change, out-migrants and in-migrants for every county in America. This summary is provided to the Census Bureau for use in estimating migration. Only the numbers of nonmovers and migrants are reported to the census bureau to retain confidentiality, and in the county to county flows small flows are suppressed as an added element to maintaining confidentiality.

Exemptions on matched returns (returns filed in both the beginning and ending year for filers under age 65 on the estimate date) are used because they have a more logical relationship with population on returns.

As valuable as these data are for estimating migration they do have limitations. They apply to persons under 65. They count filers and dependents. IRS migration misses persons who do not file tax returns in one or both years being compared so that new filers are missed. Of note to Alaska is that persons living on subsistence and not filing tax returns are missed.

Migration Rates

Migration involves two distinct movements: in-migration, those persons moving into an area; and out-migration, those moving out of an area. What is usually reported as migration is the net balance of these two forces, or 'net migration'. This is the net gain or loss to a community due to migration. Also of interest to some persons is the 'gross migration'. This is the total amount of movement as a result of adding the in and out migration. Real estate agents are frequently interested in gross migration because every time someone moves in or out they may potentially generate real estate business. If the in-migration equals the out-migration then the net migration will be zero. However, if the turnover is high, the gross migration may be quite substantial. This is generally true of places with large military populations. Station strengths may remain stable but troops are rotated on a regular basis. Tables V.3.1, V.3.2, V.3.3, and Figures V.3.1 and V.3.2 show the trends in these different migration rates for Alaska.

The statistics as they are provided by the IRS may not be released until they are converted into migration rates. This further protects against the identification of any individual. The net migration rate for any period is then defined as:

$$\text{Net Migration Rate} = \frac{\text{(Exemptions on in-migration returns) - (Exemptions on out-migration returns)}}{\text{Exemptions on matched returns (Nonmovers)}}$$

State to State Net and Gross Flows

State to state IRS migration rates for years between 1970 and 1983 are shown in Tables V.3.1 and V.3.2. Trends from 1976-77 to 1982-83 in gross and net migration to and from the states which contributed the most to the exchange of migrants with Alaska are presented in Figures V.3.1 and V.3.2.

Migration to and from Alaska can be broken into two categories, migration from out-of-state and migration between different boroughs and census areas in Alaska. In general, people tend to more frequently move short distances as opposed to long distances. It is no surprise that the states that contribute the most migrants to Alaska are the west coast and mountain states nearest to Alaska. Of all the people who have moved to or from Alaska in the 1980's, about half moved from or to: Washington (14%), California (12%), Oregon (7%), Texas (7%), Colorado (4%), Florida (4%), Idaho (3%), or Arizona (3%). The remaining states contributed 2% or less each to the stream of migrants.

The regional distribution of persons who moved to and from Alaska in the 1980's are as follows: Pacific (34%), Mountain (16%), South Atlantic (13%), West South Central (11%), East North Central (7%), West North Central (7%), East South Central (4%), Middle Atlantic (4%), and New England (3%). The South Atlantic states have a heavier than expected contribution of migrants because they are the home of a number of major military and Coast Guard bases which regularly rotate personnel to Alaska.

Given the regional distribution of migrants to Alaska, it is not surprising that while migration to and from the state is in part dependent upon federal military and program policy, it is also strongly dependent upon Alaska's economic opportunities relative to those in the West and in particular the Pacific Northwest.

In general, the states that contribute the most to an in-migration in times of prosperity in Alaska are also the ones people go back to when times get hard. Changes in in-migration, however, are more rapid than changes in out-migration. People are more easily attracted to an area than repelled from an area. If there is not a positive attraction to lure a potential migrant somewhere else, then all options to remaining in a place must be exhausted in order to force a person to leave. More often than not the decision to migrate is a mixture of attractions and repulsions which collectively effect the decision to move. While there are many factors affecting a family's or individual's decision to move, the most important factor for persons in the working ages is almost always closely associated with relative economic activity.

For a geographic area, a mix of the economic factors may affect both in-migration and out-migration. Of critical importance is the relative economic conditions in key employment industries in the primary sending and receiving states or regions. Thus, if there is logging work in Southeast Alaska at a time when the logging industry is depressed in Oregon or Washington, then there is a push for loggers to leave those states and a pull to move to Southeast Alaska. The community which relies upon a single industry is the most vulnerable to unstable migration rates. If there are several industries the effect of growth or decline can be less severe and migration flows may be more stable.

Borough and Census Area Flows

Flows of migrants within boroughs and census areas are made up of people coming from or going to out-of-state destinations and people coming from or going to other areas of Alaska. These flows for the 1980's are shown in Table V.3.3. The places and conditions which attract out-of-state migrants are not necessarily the same as those which attract people already living in Alaska.

During 1982-83, for example, the census areas which had the highest net gain in population because of migration from other areas of Alaska were: Matanuska-Susitna 12.8%, Haines 3.3%, Kenai 1.5%, Nome 1.3%, and Juneau 1.0%.

During 1982-83, the census areas which had over 5% net gain in population as a result of migration from out-of-state were: Anchorage 8.5%, Matanuska-Susitna 7.9%, Fairbanks North Star 6.4%, Bristol Bay 6.2%, Prince of Wales-Outer Ketchikan 5.9%, Southeast Fairbanks 5.7%, Kenai 5.6%, Ketchikan-Gateway 5.6%, Valdez-Cordova 5.1%, and Juneau 5.0%.

While Matanuska-Susitna, Kenai and Juneau were attractive to both Alaskans and non-Alaskan's alike, Anchorage, Fairbanks, Bristol Bay, Prince of Wales-Outer Ketchikan, Southeast Fairbanks, Ketchikan, and Valdez-Cordova were more likely to attract migrants from down south. Some of the migration to Anchorage, Fairbanks North Star and Southeast Fairbanks was due to military movement. Bristol Bay, Prince of Wales-Outer Ketchikan, and Ketchikan-Gateway were attractive to persons associated with fishing or logging from the Pacific Northwest. Valdez-Cordova outside migrants are heavily associated with the pipeline.

ERRATA - POPULATION OVERVIEW

1. P. 16, Paragraph 3, sentence 4, should read: These age trends are shown in Table II.2 and Figure 5.

The following errata apply to Tables IV.1, IV.2 and IV.3, PP. 52-77.

2. P. 77, FOOTNOTE *** Includes Census Designated Places.

3. The population estimate for Chuathbaluk City for 1983 should read 123 instead of 92 and for 1984 123 instead of 98. A corresponding change should be noted in the balance of Lower Kuskokwim census subarea: 1983 should be 43 instead of 74 and 1984 should be 37 instead of 62.

4. In Valdez-Cordova, the city of Copper Center has been misspelled as Cooper Center.

5. The following communities should have a footnote (* or **) for July 1, 1984:

* Indicates that a census was conducted in accordance with procedures contained in STANDARDS FOR CONDUCTING A CENSUS IN SMALL ALASKAN CITIES.

** Indicates a census conducted in accordance with the procedures contained in ALASKA CENSUS ADMINISTRATOR'S MANUAL and ALASKA CENSUS ENUMERATORS MANUAL.

ALEUTIAN ISLAND CENSUS AREA : King Cove City *, St. George City *, Sand Point City *.
